User Identification

- User Name: Each user has a unique username.
- Dealership Name: Users are associated with a specific dealership name.
- Dealership Location: Users are linked to the database by the geographical location of their dealership.

Access Permissions and Restrictions

- Location-Specific Access:
- Users can view information and submit orders exclusively for their specific dealership location.
- No cross-location access permitted. Users from one dealership cannot view or interact with data from another dealership.
- Data Visibility:
- All data visible to a user is restricted to their dealership's orders, inventory, production status, and sales records.
- Order Submission Rights:
- Users can only place orders pertaining to their dealership. Orders placed are tagged to the dealership's name and location for tracking and processing.

The most important component of the project is the database. It has to be easily accessible. The fields have to be small enough that the data is easily seen. The data for the database is pulled from a Google sheet. Once the Google sheet is updated, the database should be updated with the information at the same time. For the purpose of this project, a Google - e-mail would be required to provide access to the Google sheet. Please have this provided. The database should be able to filter, search, and to be able to download the current data into an Excel format if needed.

I am also attaching logos and assets to be used.
